

Thank you for downloading MIX TEMPLE FREE for Pro Tools!

QUICK OVERVIEW

The Track Preset Library supports native Pro Tools, Waves, Universal Audio, FabFilter, Native Instruments, iZotope, Slate Digital and SSL plugins.

You get started by selecting “Create New” and choosing MixTemple [Free] from the Template Groups. This will open a template that has vocal tracks and their FX routings already in place.

In the next step you drag in or import the individual audio files for your mix, or even stems of instrument groups if you work on a stem master, and select a Track Preset for each track using “Recall Track Preset”.

If you want to dive deeper into mixing and you happen to not own my book YOUR MIX SUCKS yet, the book can give you more in-depth learnings about the many techniques used in this product. You can buy the eBook on my website.

GETTING STARTED

1. Install the Pro Tools Content (Channel Strip Library & Template)

On macOS:
a) Double-click on “MixTempleFree_PT_macOS_XX.mpkg” to open the installer (XX tells you the current version).
b) Click “OK” in case a warning pops up and go to your System Preferences -> Security & Privacy
c) Click on “Open Anyway” and then confirm “Open”
d) The Installer will guide you through the next steps.

On Windows:
a) Double-click on the file “MixTempleFree_PT_WIN_XX.exe” (XX tells you the current version) and follow the instructions.

2. Open Pro Tools and setup your mix

a) Select “Create” from the popup menu or “Create New” from File drop-down menu
b) Tick the box “Create From Template” and select “MixTemple [Free]” from the Template Group.
c) Drag in or import the individual audio files for your mix
d) Select a Track Preset by left-clicking on the Track name, select “Recall from Track Preset” and navigating through the “MixTemple [Free] directory
e) All the plugin-chains like to see a signal level of roughly around -18dBFS on the input, so you should tweak the signal with a gainer in the first slot. This will ensure that your mix sessions gain structure is always in the right ballpark.
d) The FX bus structure is already in place, when you add a Send FX, you can pick an effect by the application name, e.g.

3. Mix and be happy!

Now go through the plugins in each chain and tweak until you’re happy!

If you like, you can make yourself familiar with the routing structure of the template and customise it for your needs. If you need more tracks for your session, just duplicate a track within it’s individual group.
Also you might want to save your own presets. When you do that, make sure to save them outside of the “MixTemple [Free]” folders, as any update of MIX TEMPLE FREE will overwrite this directory.

You can also build your own production template from the template by adding, for example, your favourite virtual instruments. That way you can access all the effects and routing features during production and arrangement. We are currently experimenting with more options that we will add in an update, and would appreciate if you told us what’d be helpful for your workflow.

We have already created an introduction videos for Mix Temple FREE. It’s for Logic Pro but the workflow is in all DAWs the same: https://mixedbymarcmozart.com/mix-temple-free-in-action/

We are working on some in-depth tutorials that will be released through our social media channels. I will of course also send you links to these videos via e-mail so please make sure to add my e-mail address

feedback@mixedbymarcmozart.com

to your address book, and **send me a quick “Hello” or any feedback or questions you might have**. There will be regular updates for MIX TEMPLE FREE so stay tuned!

Please also check the FAQ below!

Best,
Marc Mozart & Team

FAQ - Frequently asked questions

Q: The installer doesn't open on my system!
A: This is a known issue on systems Mac OS Sierra and older. Please e-mail us and let us know the operating system you are running and we will provide you with an installer that will work for your older system.

Q: The stock Pro Tools plugins are missing on my system!
A: If you want to use the stock Pro Tools plugins please make sure that you install the Avid Complete Plug-In Bundle and Avid First AIR Effects Bundle.

Version History

Version 1.1 released October 2021
• support for Universal Audio

Version 1.2 released November 2021
• support for FabFilter
